

Evergreen Fire Simulation Program-FLAMES
Nov. 1-3,2000 Ottawa, Canada
LeMar St.John

The purpose of this trip was to discuss the modification of Contract/order number R220P982036. The contract calls for modification of the FLAMES simulation model to improve its prescribed fire capabilities and to add extended attack and visual data base capabilities.

FLAMES is a fire simulation model used for training. It is a user friendly computer simulation model that is used to train fire personnel in initial attack tactics.

Specific details about each aspect of the contract were discussed along with conceptual plans for accomplishment. Due to the severity of the 2000 fire season, it was agreed to extend the completion date of the contract until May of 2001.

The trip successfully accomplished many objectives that could not have been accomplished without the personal interface between the contractor and the contract COR.
